considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligomucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide

  The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed carivity of (II) or to treat disease states involving (II). (II) is activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food polypement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving abbarrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in adjustical and products format directly from NIPO at the printed specification, but was obtained in the contract of the cont

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

10-APR-2003

Claim 1; Page 170; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) at the composition described above; in one or more containers, the composition described above; (3) an isolated nucleic acid molecule above polypeptide described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a farsate associated with altered levels of expression of the above a polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10.) a method for identifying a potential therapeutic agent for a berrant physiological interactions of the polypeptide; (11) a method of general physiological interactions of the polypeptide; (12) a method of method of a pathology associated with the polypeptide for modulator; or preventing a pathology associated with the above polypeptide; (11) a method of preventing a pathology associated with the above polypeptide; or preventing a pathology associated with the above polypeptide or the nucleic and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for reacting and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for reacting a cancer, and can be used in gene therapy. The acid molecule may be used to diagnose, treat or prevent metabolic acid molecule may be used to diagnose, treat or prevent metabolic acid solated with a human disease. The polypeptide or preventive disorders such as diabetes or obesity, inference or the polypeptide present invention.

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.

Claim 1; Page 169-170; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOVI). Also described: (1) a composition comprising a polypeptide
described above and a carrier; (2) a kit comprising, in one or more
containers, the composition described above; (3) an isolated nucleic acid
molecule which encodes a NOVX protein of the invention; (4) a vector
comprising the nucleic acid molecule described above; (5) a cell
comprising the above vector; (6) an antibody that immunospecifically
binds to the polypeptide described above; (7) methods for determining the
presence or amount of the above polypeptide or nucleic acid molecule in a
sample; (8) methods for determining the presence of or predisposition to
a disease associated with altered levels of expression of the above
colypeptide or nucleic acid molecule in a first mammalian subject; (9) a
method of identifying an agent that binds to the polypeptide described
above; (10) a method for identifying a potential therapeutic agent for
use in treating a pathology that is related to an aberrant expression or
aberrant physiclogical interactions of the polypeptide; (11) a method of
screening for a modulator of activity or of latency or predisposition to

Sequence 253 AA;

field.)

ន្តដូន

```
a pathology associated with the polypeptide, (12) a method for modulating the activity of the polypeptide described above, (13) methods of treating or preventing a pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide in a method for producing the above polypeptide. Novx sequences have antidiabetic, anorectic, antibacterial, virucide, immunondulator, cytostatic, nootropic, neuroprotective, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various dyslipidaemias. The nucleic acids can also be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The present sequence represents a human NoVX from the present invention.

Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.

Example 6; Page 37; 74pp; English

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, operably linked to a promoter that drives expression of heterologous scce or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or testing of a commercial or a harmaceutical formulation, and for the development of a diagnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an pritaris, acopic dermatitis, eczema, acne and inherited skin diseases with epidermal hyperkeratosis. Phe mammal of the invention skin diseases which hyperkeratosis, acathosis, epidermal inflammation, dermal inflammation, dermal inclammation, dermal inclammation of the human stratum corneum chymotryptic enzyme, SCCE transgenic mammals described in the invention

Novel genes which are differentially regulated in prostate cancer, usel for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.

Claim 1; Page 293-294; 416pp; English.

The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of the probability that the sample, where the number is indicative of the probability that the sample, where the number is indicative of the probability that the sample comprises prostate cancer. (I) Is useful for assessing a therapeutic or preventive contervention in a subject having a prostate cancer. which involves contesting a prostate cancer. Which involves contesting a prostate cancer. Preferably, the expression levels in a sample comprising prostate tissue of target genes which are differentially regulated in prostate cancer. Preferably, the expression levels of at least 10 genes are determined.

(I) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity of the prostate cancer cells with a test agent under conditions effective for the test agent to modulate such biological activity. (I) is useful as molecular markers, as drug targets, and for detecting, preventing or treating, determining predisposition to diseases and conditions especially relating to prostate cancer. (I) and its expression conditions especially relating to prostate cancer. (I) and its expression conditions especially relating to prostate cancer. (I) and its exact of cancer of cancer, in tissue sections, in biopsy sample, in total RNA, in lymph, in blood etc. (I) is useful for assessing cancer e.g., to determine the type of eventomer, its atage of development, the nature of genetic defect, etc. The polypeptide encoded by (I) can be used as target for therapy or drug discovery. (I) can also be used for expressing the polypeptide and thus content of the polypeptide encoded by (I) can be used as target for the rapeutic applications to treat prostate of specific genes, and groups of genes, expressed in pathways physiologically relevant to prostate cancer permits the definition of functional and disease pathways and the delineation of targets in these pathways which are useful in disquostic, therapeutic, and clinical applications. This is the amino acid sequence of a protein differentially applications. This is the am regulated in prostate cancer

  The invention relates to a method of detecting an ovarian cancerassociated transcript in a cell from a patient, by contacting a beloogical sample from the patient with a polynucleotide that selectively hybridizes to a sequence at least 80% identical to any of one of 80 nucleic acid sequences given in the specification. The method is useful in diagnosing ovarian cancer and in identifying and using agents and/or targets that inhibit ovarian cancer. The nucleic acid molecule, polypeptide and the antibody may also be used in detecting ovarian cancers, monitoring and early detection of relapse following treatment, monitoring response to therapy, selecting patients for post-operative chemotherapy or radiation therapy, in selecting mode of therapy, and as vaccines. This sequence corresponds to one of the proteins used for the detection method of the invention.
   Detecting an ovarian cancer-associated transcript in a cell from a patient, comprises contacting a biological sample from the patient with a polynucleotide that hybridizes to an ovarian cancer gene.

Diagnosing cancer comprises detecting stratum corneum chymotrypsin enzyme.

Claim 25; Page 102; 127pp; English.

The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonuclectide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
cleaves insulin B chain at 6-Leu-|-Cys-7, 16-Tyr-|-Leu-17, 25-Phe-1-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation of precursors to inflammarory cytokines.

TISSUE SPECIFICITY: Abundantly expressed in the skin and is expressed by keratinocytes in the epidermis. Very low levels are also seen in the brain and kidney.

SIMILARITY: Belongs to peptidase family SI. Kallikrein subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      FKII_MOUSE STANDARD; PRT; 201 AA.

"The complete sequence of the I,633-kb pSymB megaplasmid from the N2-fixing endosymbiont Sinoptium meliloci.",

Proc. Natl. Acad. Sci. U.S.A. 98:9889-9894(2001).

-!- PATHWAY: Exopolyyaaccharide biosynthesis a

-!- SABTELLULAR LOCATION: Integral membrane protein (Probable).

-!- SIMILARITY: Belongs to the polysaccharide synthase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

Ravid S., Spudich J.A.;

Transe-bound Dictyostelium myosin heavy chain kinase: a developmentally regulated substrate-specific member of the protein kinase C family.";

L. Proc. Natl. Acad. Sci. U.S.A. 89:5877-5881(1922).

L. Proc. Natl. Acad. Sci. U.S.A. 89:5877-5881(1922).

L. PRINCTION: Brings about phosphorylation of specific threonines in the heavy chains of myosin during chemotaxis, which results in inhibition of myosin thick filament formation. Phosphorylation also inhibite the actin-activated ATPase activity of myosin.

C. -I- CATALYTIC ACTIVITY: ATP + [myosin heavy-chain] = ADP + [myosin heavy-chain] phosphate.

C. -I- SUBCELIULAR LOCATION: Membrane-bound.

C. -I- BEVELOPMENTAL STAGE: Expressed only during development.

C. -I- SIMILARITY: Belongs to the eukaryotic diacylglycerol kinase
                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -!- SIMILARITY: Contains 2 zinc-dependent phorbol-ester and DAG binding domains.
-!- CAUTION: While this is experimentally defined to be a protein kinase, it could be, on the basis of sequence similarities, a diacylglycerol kinase.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 4, Application US/09654600A

Sequence 4, Application US/09654600A

Patent No. 6649741

GENERAL INPORMATION:

APPLICANT: O'Brien, Timothy J.

APPLICANT: O'Brien, Timothy J.

TITLE OF INVENTION: TARG-15: An Extracellular Serine Protease

TITLE OF INVENTION: TOVEREXPESSED IN CARCINOMAS

TITLE OF INVENTION: TOVEREXPESSED IN CARCINOMAS

TITLE OF INVENTION: TOVEREXPESSED IN CARCINOMAS

CURRENT APPLICATION WINBER: US/09/654,600A

CURRENT PILING DATE: 1999-10-20

PRIOR FILING DATE: 1999-10-20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 2, Application US/08557146
Patent No. 5834290
GENERAL INFORMATION:
APPLICANT: Bgelrud, Torbjorn
APPLICANT: Hansson, Lennart
TITLE OF INVENTION: Recombinant Stratum Corneum Chymotryptic
TITLE OF INVENTION: Enzyme (SCCE)
NUMBER OF SEQUENCES: 17
TITLE OF INVENTION: TADG-15: An Extracellular Serine Protease TITLE OF INVENTION: Overexpressed in Carcinomas FILE REFERENCE: D6064C1PD/D CURRENT APPLICATION NUMBER: US/09/644,600 CURRENT FILING DATE: 2000-08-23 PRIOR APPLICATION NUMBER: 09/421,213 PRIOR FILING DATE: 1999-10-20 PRIOR FILING DATE: 1999-10-20 PRIOR FILING DATE: 1999-02-20 NUMBER OF SEQ ID NOS: 98 LENGTH: 225
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        100.0%; Score 50; DB 4; Length 225; Conservative 0; Minner.

#### ALIGNMENTS

```
The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCB). Proteases are considered to be an integral part of tumuur growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, to treat a cancer spletched from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide
                                                                                            Human stratum corneum chymotrypsin enzyme peptide #50 (residues 207-215)
                                                                                                                         Stratum corneum chymotrypsin enzyme; SCCE; cytostatic; vaccine; tumour; cancer; ovarian; breast; lung; colon; prostate; carcinoma; human; antisense therapy; malignant hyperplasia.

The present invention describes NoVX proteins, where X can be 1 to 55 cc (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit composition or more containers, the composition described above; (3) an isolated nucleic acid containers, the composition described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (5) a cell comprising the polypeptide described above; (6) a cell comprising the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above compression or treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide described above; (10) a method for identifying a potential therapeutic agent for aberrant physiological interactions of the polypeptide (11) a method of a pathology associated with the polypeptide; (12) a method for modulating or pathology associated with the polypeptide; (12) a method for modulating or pathology associated with the above polypeptide. NoVX or preventing a pathology associated with the above polypeptide or the nucleic and antilipaemic activities, and can be used in gene therapy. The community appearance and antilipaemic activities, and can be used in gene therapy. The controlled may be used to diagnose, treat or prevent metabolic contents and antilipaemic activities, and can be used in gene therapy. The controlled may be used to diagnose, treat or prevent metabolic content of discorders such as diabetes or obesity, infections, cancer, concerved discorders such as diabetes or obesity, infections, canceris, cancer, in chromosome mapping, issue typing, preventive mentalicine and propes, in chromosome mapp
                                                         New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    human; NOVX; antidiabetic; anorectic; antibacterial; virucide; immunomodulator; cytostatic; nootropic; neuroprotective; antiparkinsonian; antilipaemic; gene therapy; human disease; metabolic disorder; diabetes; obesity; infection; cachexia; cancer; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; dyslipidaemia.

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics

Claim 1; Page 170; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55

(e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or

```
containt physiological interactions of the polypeptide; (11) a method of acreening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulating the activity of the polypeptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide; nor amanal; and (14) a method for producing the above polypeptide; now account and antidiabetid, ancreating the above polypeptide. Now, sequences have antidiabetid, ancreating, neuroprotective, antiparkinsonian antilipament cativities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating a syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to diagnose, treat or prevent metabolic calledrates such as diabetes or obesity, infections, cachexia, cancer, neurodegenerative disorders such as Alzhaimer's disease or Parkinson's disorders uncleic acids can also used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and processent invantion
                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  human, NOVX, antidiabetic, anorectic, antibacterial, virucide, immunomodulator, cytostatic, nootropic, neuroprotective, antiparkinsonian, antilipaemic, gene therapy, human disease, metabolic disorder, diabetes, obesity, infection, cachexia, cancer, neurodegenerative disorder, Alzheimer's disease, Parkinson's disease, immune disorder, haematopoietic disorder; dyslipidaemia.

Novel extracellular serine protease, termed tumor antigen-derived gene 15 protein overexpressed in carcinomas and DNA encoding it, for diagnosis, treatment, prevention of cancer, particularly breast, ovarian cancer.

Example 10; Fig 1; 130pp; English.

Human Stratum Corneum Chymotryptic Enzyme, SCCE, catalytic domain. Human; TADG-15; cytostatic; vaccine; ovarian tumour; cancer;

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising in one or more containers, the composition described above; (3) an isolated nucleic acid molecule dascribed above; (3) an isolated nucleic acid molecule described above; (5) a cell or comprising the nucleic acid molecule described above; (5) a cell or comprising the nucleic acid molecule described above; (5) a cell or binds to the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence of or predisposition to a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying an agent that binds to the polypeptide described above; (10) a method for identifying a pathology that is related to an aberrant expression or use in treating a pathology that is related to an aberrant expression to aberrant physiological interactions of the polypeptide; (11) a method of a citivity or of latency or predisposition to a pathology associated with the polypeptide; (12) a method for modulator of activities described above; (13) method of activities, and carrivity of the polypeptide described above; (13) method of a modulator, cyctostatic, antibacterial, virucide, or mammal; and (14) a method for producing the above polypeptide in a method for producing the above polypeptide is useful in manufacturing a medicament for treating a pathology associated with a hours of an endicament for treating a special in manufacturing a medicament for treating a special in an endicament for treating a special in manufacturing a medicament for treating a special activities, and can be used in gene therapy. The syndrome associated with a human disease. The polypeptide or the nucleic acid molecule may be used to disance, treat or prevent metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders, haematopoietic disorders and various dyslipidaemias. The nucleic acids can also be used as hybridisation probes, in chromosome mapping, tissue typing, preventive medicine and pharmacogenomics. The present sequence represents a human NOVX from the

TADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protein or its fragments of 9-20 residues that lack TADG-15, protein, y are useful for vaccinating entidividual against TAOG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0; Gaps

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or

# Claim 1; Page 172; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described: (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comprising, in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the above vector; (6) an antibody that immunospecifically binds to the polypeptide described above; (7) methods for determining the

```
presence or amount of the above polypeptide or nucleic acid molecule in a adhesea associated with altered levels of expression of the above a disease associated with altered levels of expression of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for use in treating a pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide described of greening for a modulator of activity or of latency or predisposition to a pathology associated with the polypeptide; (11) a method of the activity of the polypeptide described above; (13) methods of treating or preventing a pathology associated with the above polypeptide in a mammal; and (14) a method for producing the above polypeptide in a mammal; and (14) a method for producing the above polypeptide; NoVX sequences have antidabetic, anometric, antibacterial, virucide, immunomodulator, cytostatic, anometric, antibacterial, virucide, immunomodulator, cytostatic, anometric, antibacterial, virucide, immunomodulator, cytostatic, nootropic, neuroprotective, antipaxinsonian and antilipaemic activities, and can be used in gene therapy. The cold molecule may be used to diagnose, treat or prevent metabolic disorders such as diabetes or obesity, infections, cancer, neurodegenerative disorders such as Alzheimer's disease or Parkinson's disease, immune disorders such as Alzheimer's disease or Parkinson's dispense, immune disorders such as Alzheimer's disease, immune disorders such a shaden and various mapping, tissue typing, preventive medicine and probes, in ohromosome mapping, tissue typing, preventive medicine and present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    human, NOVX; antidiabetic; anorectic; antibacterial; virucide; immunomodulator; cytostatic; nootropic; neuroprotective; antibacatic; gene therapy; human disease; metabolic disorder; diabeters; obesity; infection; cachexia; cancer; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; dyslipidaemia.

New NOVX polypeptides and nucleic acids, useful for diagnosing, preventing or treating NOVX-associated disorders, e.g. diabetes, obesity, cancer or dyslipidemia, and in chromosome mapping, tissue typing or pharmacogenomics

# Claim 1; Page 169-170; 586pp; English.

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described (1) a composition comprising a polypeptide described above and a carrier; (2) a kit comportsing; in one or more containers, the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell comprising the nucleic acid molecule described above; (6) a cell comprising the polypeptide described above; (7) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence or amount of the above adjease associated with altered levels of expression of the above a disease associated with altered levels of expression of the above a disease associated with altered levels of expression of the above a polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method for identifying an agent that binds to the polypeptide described above; (10) a method for identifying an pathology that is related to an aberrant expression or aberrant physiological interactions of the polypeptide; (11) a method of somethod for modulator of activity or of latency or presipposition to a pathology associated with the polypeptide; (12) a method for modulator of activity of the polypeptide described above; (13) method for producing the above polypeptide in a manufacturing a method for producing the above polypeptide or the nucleic and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a method for producing and antilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a method for producing and antilipaemic activities, and can be used in gene therapy. The priese such as diabetes or obesity, infections, can be used to diagnose, treat or prevent metabolic displacements in chromosome mapping, issue typing, pheres and such as advanced and a

The present invention describes NOVX proteins, where X can be 1 to 55 (e.g. NOV1). Also described and a carrier; (2) at the composition comprising a polypeptide described above and a carrier; (2) at the composition described above; (3) an isolated nucleic acid molecule which encodes a NOVX protein of the invention; (4) a vector comprising the nucleic acid molecule described above; (5) a cell of comprising the nucleic acid molecule described above; (5) a cell of physpetide described above; (5) a cell of presence or amount of the above polypeptide or nucleic acid molecule in a sample; (8) methods for determining the presence or amount of the above polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying an agent that binds to the polypeptide described above; (10) a method for identifying a potential therapeutic agent for a polypeptide or nucleic acid molecule in a first mammalian subject; (9) a method of identifying a pathology that is related to an aberrant expression or a berrant physiological interactions of the polypeptide; (11) a method of a pathology that is related to an aberrant expression of activity of a pathology associated with the polypeptide; (12) a method for modulator of activity or of latency or predisposition to a pathology associated with the polypeptide described above polypeptide in a mammal; and (14) a method for producing the above polypeptide in a method for producing the above polypeptide or the nucleic and annilipaemic activities, and can be used in gene therapy. The polypeptide is useful in manufacturing a medicament for treating a pathology associated with the above polypeptide or the nucleic syndrome associated with a human disease. The polypeptide or the nucleic acids and an aborative disorders such as allowed associated with a human disease. The polypeptide or particulation and disease or obesity, inference or polypeptide and sociated with a human disease. The polypeptide or particulation and disease, in chromosome mapping, issue typing, present

```
The enzyme encoded by this sequence is used in pharmaceutical, cosmetic and skin care products, especially to treat and prevent acne, xeroderma, or other hyperkratchic conditions (e.g. callosities or keratosis pilaris), ichthyoses, psociasis, eczema, etc. It is produced recombinantly following mammal, insect, plant, or microorganism transformation with plasmid pS507. New isolated human amyloid precursor protein protease - used to develop prods. for the treatment or diagnosis of associated conditions, esp. Alzheimer's disease.

Claim 1; Page 44-45; 55pp; English.

Human amyloid precursor protein protease (AAW05383) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAM39783) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryotic (partic. E. coli) or eukaryotic and testing of cpds. useful for treating or develop products for the design and testing of cpds. useful for treating or preventing conditions associated with beta-amyloid peptide, esp. Alzheimer's disease

Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in Skin.

# Example 6; Page 37; 74pp; English.

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, operably linked to a promoter that drives expression of heterologous scce or its variant in skin. The product of the invention is useful as a model.

Corrections a pathogenic condition, for development, to relieve or ameliorate a pathogenic condition, for development or testing of a comment or a pharmaceutical formulation, and for the development of a diagnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an compound or composition effective for the prevention or treatment of an inflammatory skin diseases selected from diseases consisting of epidermal continuity, atopic dermatitis, eczema, acne and inherited skin diseases or prunitus, atopic dermatitis, eczema, acne and inherited skin diseases or with epidermal hyperkratosis. The mammal of the invention is also useful as a model for further studies of itch mechanisms and the testing of potential compounds and compositions for relieve of various skin diseases compositions compensents the N-terminal compounds and compositions for relieve of various skin diseases compensent of the human stratum corneum chymotryptic enzyme, SCCE transgenic mammals described in the invention 88888888888888888888888

Transgenic mammal or its embryo useful as model for human disease, has hererologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.

# Claim 10; Page 58-59; 74pp; English.

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence

```
coding for a stratum corneum chymotryptic enzyme (SCCE) or its variant, operably linked to a promoter that drives expression of heterologues acce or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve or amelioarde a pathogenic condition, for development or testing of a cosmetic or a pharmaceutical formulation, and for the development of a diagnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an inflammatory skin diseases selected from diseases consisting of epidermal hyperkeratosis, epidermal inflammation, dermal inflammation, pruritus, atopic dermatities of itch mechanisms and the testing of potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the human stratum chymotryptic enzyme, SCCE which is a serine procease synonymous with human kallikrein 7 (KLK7) and is used in the development of the

WPI; 2002-139913/18. N-PSDB; ABK31782 Nucleic acids encoding novel human proteases, useful for useful for treating diseases and disorders such as cancers, immune-related diseases and disorders, cardiovascular disease (e.g. restenosis) and inflammatory disorders

```
The present invention relates to the isolation of novel human proteases, and the mucleic acide encoding them. The sequences of the invention are useful for treating diseases and disorders such as cancers (e.g. breast, colon, lung), immune-related diseases and disorders (e.g. inflammatory diseases and asthma) cardiovascular diseases (e.g. inflammatory diseases and asthma) cardiovascular diseases (e.g. inflammatory coronary thrombosis), brain or neuronal-associated diseases, metabolic disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. cheumator) attributes and psoriasis), central or peripheral nervous system diseases, migraines, pain, sexual dysfunction, mood disorders attention disorders, cognition disorders, hypotension, hypertension, psychotic disorders, usurological disorders (e.g. Alzhaimer's disease, Parkinson's disease) and dyskinesias. The mucleic acids and polypeptides are also useful for treating viral infections caused by human immunodeficiency virus filly, and non-viral infections such as ocular disease (e.g. human proteases of the invention.

WPI; 2003-058520/05. N-PSDB; ABX10343 Novel genes which are differentially regulated in prostate cancer, useful for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.

Claim 1; Page 293-294; 416pp; English.

The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially regulated in the sample, where the number is indicative of the probability that the sample comprises

```
proseque cancer. (1) is useful for assessing a comprising prostate tissue determining the expression levels in a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer. Preferably, the expression levels in a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer. Preferably, the expression levels of at least 10 genes are determined. (1) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent modulates the polypeptide, and determining whether the test agent modulates the polypeptide, and determining whether the test agent modulates the polypeptide, and determining or treating, assessing, monitoring, prognostication, is useful as molecular markers, as drug targets, and for detecting, products are used in the diagnostic test to assay for presence of cancer. (1) and its expression products are used in the diagnostic test to assay for presence of cancer. e.g., in tissue sections, in biopsy sample, in total RNA, in lymph, in blood etc. (1) is useful for assessing cancer e.g., to determine the type discovery. (1) can also be used dea target for therapy or drug discovery. (1) can also be used dea target for therapy or drug discovery. (1) can also be used dea target for therapy or drug discovery. (1) can also be used to restressing the polypeptide and thus functional and disease pathways and the delineation of targets in these pathways which are useful in diagnostic, therapeutic, and clinically relevant to prostate cancer permits the definitially approach and sequence of a protein differentially and second sequence of a protein differentially applications.
